

GMN is introducing the tolerance class P4+. This tolerance alleviates the need for any additional; high marking, grading, or matching. This is a direct cost savings to your bottom line! The P4+ is being phased in through 2016 into 2017 across the entire super precision angular contact bearing range.

The same quality you expect from GMN will continue, but with additional tolerancing printed right on each bearing box and each bearing. ID, OD, and width deviations are all present along with an inner race high point mark. Please see the examples below and feel free to contact GMN USA with any questions.

PN = HYS 6006 ETA P4+ UL

ID = -3 microns below nominal

OD = -1 micron below nominal

Width = -43 microns below nominal

IR High Point = ~1 O'clock within example

T274 = Lubcon L252 Grease

*More grease codes on subsequent PDF
